

Mobile Sales Performance Analysis

An end-to-end data analytics portfolio project designed to track, analyze, and visualize mobile phone sales performance metrics. This project leverages SQL for backend data structuring and Power BI for frontend business intelligence, providing actionable insights into revenue generation, brand performance, and consumer purchasing behavior.

Project Overview

This repository contains the documentation, source files, and presentation assets for the Mobile Sales Dashboard. As a Data Analytics project, the primary objective is to transform raw transaction records into an interactive executive dashboard that facilitates data-driven decision-making.

Data Source

The primary dataset utilized for this analysis is stored in the **Mobile Sales Data.xlsx** file. It serves as the foundational data source containing the transaction records, product details, and temporal data required to build the business intelligence model.

Tech Stack

- **Data Storage & Cleaning:** Microsoft Excel, MySQL
- **Data Visualization & Business Intelligence:** Power BI
- **Key Power BI Techniques:** Star Schema Data Modeling, DAX (Data Analysis Expressions), Time Intelligence Functions, Power Query

Dashboard Features & KPIs

The Power BI report is divided into three primary interactive pages:

1. **Executive Dashboard:**
 - **Core KPIs:** Tracks overall Total Sales (769M), Total Quantity (19K), Total Transactions (4K), and Average Price (40.11K).
 - **Geospatial Mapping:** Visualizes total sales by city across India to identify high-performing regional markets.
 - **Brand & Model Analysis:** Details sales distribution across top brands (Apple, OnePlus, Samsung, Vivo, Xiaomi) and specific mobile models.
 - **Consumer Behavior:** Provides a transaction breakdown by payment method (UPI, Debit Card, Credit Card, Cash) and customer rating status (Good, Average, Poor).
2. **MTD (Month-to-Date) Report:**
 - A granular, day-by-day time series tracking Month-to-Date sales volume, quantities, and transaction counts.
 - Enables stakeholders to monitor daily momentum and identify intra-month purchasing trends.
3. **Same Period Last Year (SPLY) Report:**
 - **Time Intelligence:** Utilizes custom DAX measures to compare current performance against historical data.
 - Features Year-over-Year (YoY), Quarter-over-Quarter (QoQ), and Month-over-Month

(MoM) visual comparisons to highlight periods of growth or contraction.

Key Insights Discovered

- **Dominant Payment Methods:** Transactions are evenly distributed among UPI, Debit, Credit, and Cash (each representing ~24-26% of the volume), indicating highly versatile consumer payment preferences.
- **Top Performing Brands:** Apple and OnePlus drive the highest overall sales volume, with specific models like the iPhone 14 and OnePlus Nord leading their respective categories.
- **Seasonal Momentum:** The MTD daily tracking reveals consistent sales cyclicity throughout the month, providing a clear baseline for future inventory and promotional planning.

Installation & Usage

1. Clone this repository to your local machine.
2. Download the raw data file, Mobile Sales Data.xlsx, to review the underlying schema.
3. Open the provided .pbix file using Power BI Desktop to interact with the dashboard.
4. Ensure data source paths in Power Query are updated to your local directory if you intend to refresh the dataset.
